

COOPERATIVE ECONOMIC INSECT SURVEY REPORT  
Glenn A. Salsbury, Survey Entomologist

Report 13, Volume 58  
September 15, 2010

There is currently a large flight of both CORN EARWORMS and FALL ARMYWORMS occurring in Southeast Kansas. With wheat planting just beginning across the state growers need to be vigilant and watch especially for fall armyworm infestations. Likewise with seedling alfalfa as both earworms and armyworms can cause considerable damage. There have been many fields of soybeans sprayed for earworms and in western Kansas some fields of double crop beans have been sprayed as many as three times. Some fields of seedling alfalfa have had to be sprayed for GRASSHOPPERS and growers should also watch for this pest along the margins of wheat and alfalfa.
